**Abstract:** In order to cultivate information literacy among college students, the Chinese government has formulated a series of relevant policies as well as revised and adjusted the policy priorities along with the times. Guided by co-word and social network analysis, this study analyzes 170 policy texts that have been promulgated by the Chinese government from 1981 to 2020. Based on the clustering results of high-frequency keywords, this study explores the characteristics of policy evolution and its influencing factors from three dimensions: policy themes, contents of information literacy education, and the methods for cultivating information literacy education. Several suggestions have also been put forward in this article to improve the information literacy education policy for Chinese college students.

**Keywords:** Information literacy education; Policy evolution; Social network analysis; Co-word analysis

**Publication date:** September 2021; **Online publication:** September 30, 2021

## 1. Introduction

With the development of information technology, the demand for talents with high information literacy is gradually increasing. College students shoulder an essential mission in the socialist construction, which is to develop new thinking in learning, cultivate innovation skills, and improve in information literacy. There are many research on information literacy education for college students; in addition, policy trend literatures and research are abundant as well <sup>[1]</sup>. The Chinese government has promulgated a series of standardized regulations, policies, and rules. In January 1981, the Ministry of Education (MOE) promulgated the *Regulations of the People's Republic of China on the Work of Libraries in Higher Education Institutions* as China's first official document emphasizing on university libraries. It is the mark whereby university libraries in China have begun to enter into a stage with laws to comply with <sup>[2]</sup>. In February 2002, MOE issued the *General Provisions of the General Higher Education Library Regulations (Revised)*. It clearly states that the main tasks of university libraries are to carry out information literacy education, cultivate information awareness among college students, and acquire literature information <sup>[3]</sup>. In 2012, MOE promulgated the *Ten-Year Development Plan for Education Informatization (2010-2020)*, which clearly states that it is necessary to promote informatization, strengthen the deep integration of higher education and information technology, as well as establish high-quality educational resources for sharing <sup>[4]</sup>. In 2018, according to the *Action Plan for Education Informatization 2.0*, MOE emphasized on establishing a scientific, suitable, and highly operable evaluation index system as well as an evaluation model for students' information literacy <sup>[5]</sup>. This policy marks the strategic deepening stage of information literacy education

for college students in China.

Although the information literacy education policy is deepening, there are only a few research on it. At present, the research mainly focuses on literature; thus, unable to depict or describe the overall evolution characteristics of information literacy education. Based on the clustering results of high-frequency words, this article constructs a comprehensive analysis framework of the information literacy education policy for college students in China from three dimensions: policy themes, contents of information literacy education, and the methods for cultivating information literacy education. The qualitative and quantitative analysis, objective and transparent description of various stages of information literacy education policy among college students, as well as the exploration of policy goals <sup>[6]</sup> can clarify the scope of policy evolution and grasp the direction of its development.

## 2. Data source and research method

### 2.1. Data source

The information literacy education policy for college students issued by the Central Government of China from 1981 to 2020 was used as the research subject. The data used in this study were selected from the websites of Chinese government departments, such as the MOE. In order to search for and collect relevant policy texts, this study used this method: “Title” = (higher institution OR university OR university library) AND (information literacy). Finally, 150 influential policy texts were selected, and a policy text database was established (**Figure 1**).

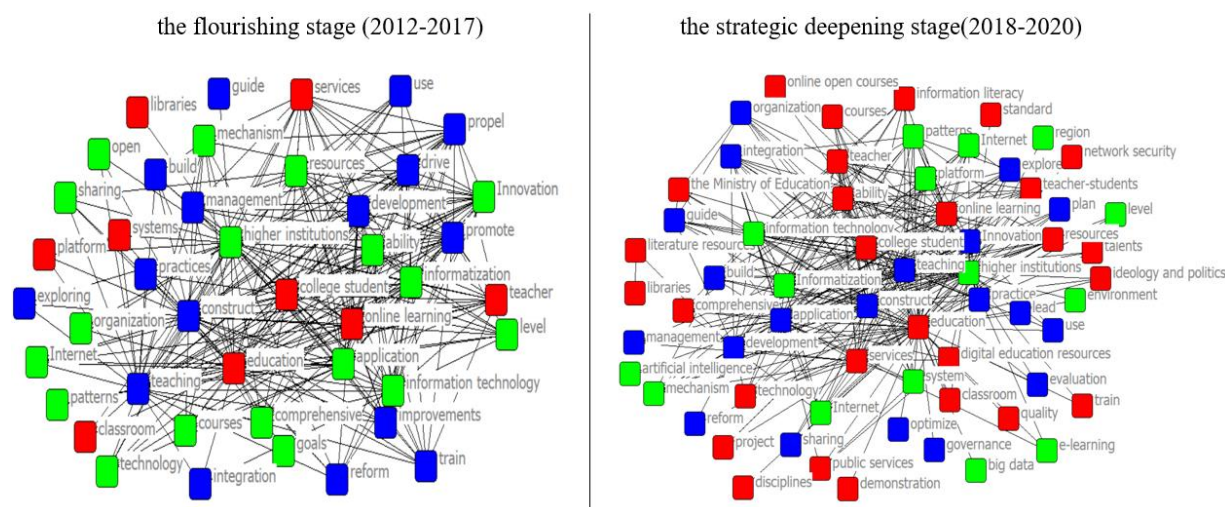

**Figure 1.** The distribution of information literacy education policy for college students in China from 1981 to 2020

### 2.2. Research method

The academic literature keywords were used as the research subject in the co-word analysis, which is an important research method in bibliometrics. In the past, when the government was developing policy literature, it is common to regard keywords that represent the core content of a document as the theme words <sup>[7]</sup>. Applying the social network analysis to policy text analysis, high-frequency keywords extracted from enterprises and government agencies related to a specific policy area can be analyzed by comparing the similarity of individual connection structures <sup>[8]</sup>. Therefore, the terms used in this study include terms from early literature and bibliometrics. The co-word and social network analysis were used in this study to obtain representative policy terms and explore their evolutionary characteristics.

critical development stage of information-based education. The high-frequency keywords at these stages were compiled into a co-word matrix. ROST CM6 was used to form a network graph of the co-word matrix to perform the corresponding cluster analysis (**Figure 3**) [9].

**Figure 3.** The distribution of high-frequency keywords of information literacy education policy for Chinese college students from 2012 to 2020

According to **Figure 3**, several deductions can be derived.

- (1) In regard to policy themes, “teaching,” “informatization,” and other related keywords appeared more frequently at these stages, indicating that information literacy education still relies on information technology. With the growth of the internet, various virtual technologies and software are used for teaching, thus making the course more vivid and easy for students to understand [10]. At the same time, there is an increased in keywords such as “innovation,” “technology,” and “ability” in the strategic deepening stage, indicating that information literacy has started to focus on teaching and curriculum innovation. Cultivating college students’ information literacy is gradually changing from traditional literature retrieval to integrating information technology and education.
- (2) In regard to the contents of information literacy education, the improvement of college students’ information literacy skills lies in the deep integration of information technology and education as well as the full use of the internet, communication satellite, etc., to promote information literacy education toward digitalization, networking, and modernization. The growth of information technology has transformed the traditional teaching model and improved the practical ability of information retrieval among college students. Higher education institutions have adopted ideological and political education as well as internet thinking to promote the close integration of ideological and political work with information awareness.
- (3) In regard to the methods of cultivating information literacy education, the theme words appeared more frequently at these two stages. It shows that the Chinese government is gradually building a robust platform of “Internet Plus Education.” Further promoting the deep integration of information technology and education, such as big data and AI, can encourage teaching and management transformation. At the same time, there is a significant increase in the theme words, indicating that the main subjects of information literacy improvement are college students and teachers.

## 4. Conclusion

By analyzing the characteristics of different stages, this article draws several conclusions.

- (1) In terms of policy, the information literacy policy system for Chinese college students has four stages: exploration, steady development, vigorous growth (flourishing), and strategic deepening. In the exploration stage, the concept of “information literacy” had not been formed in China, nor the independent policy system. At this time, the cultivation of information literacy was mainly realized by literature retrieval courses. During its steady development, the government focused on the construction of university libraries, public services, and other infrastructure. In addition to that, the information literacy education shifted its focus from literature retrieval skills to information consciousness and morality. In the flourishing stage, digital and online education promoted the deep integration of information technology and education. In the strategic deepening stage, the Chinese government encouraged teaching, curriculum innovation, and information literacy education, in addition to the emergence of big data, artificial intelligence, and diversified teaching.
- (2) In terms of policy evolution, the theme gradually changed from a single to compound type, from the construction of college information infrastructure to the deep integration of technology into education, as well as from the deep promotion of information literacy education to the promotion of network literacy culture. The contents of information literacy education are improving as exemplified by the shift from traditional literature retrieval to information consciousness and morality. The cultivation of information literacy has undergone a gradual transformation from literature retrieval courses, campus network construction, information literacy education, and the combination of online and multimedia teaching to curriculum innovation. In regard to policy measures, its evolution began from the construction of university libraries to the introduction of diversified information resources, the reform of the information literacy curriculum, and the improvement of college students’ information literacy evaluation system.
